Hans

Clinical database lock means that all of the clinical data has undergone the necessary QC and edit checks and that the data is ready to be used for analysis. This does not include the lab data. We have indicated six weeks after database lock, because at this time we anticipate that the majority of the lab data will be available. We cannot lock the lab data until all of the data is in house. Hope this clarifies things, if you have any more questions please let me know.

Kind regards

Jane
